KEENESBURG, COLORADO 80643

FOR

SILYLATED AND N-SILYLATED COMPOUND SYNTHESIS

SILYLATED AND N-SILYLATED COMPOUND SYNTHESIS

FIELD OF INVENTION

5 the synthesis of silylated and N-silylated organic compounds
therewith.

BACKGROUND OF THE INVENTION

ligands involve the addition of $\text{Cl}_2\text{Si}(\text{CH}_3)_2$ during synthesis of monocyclopentadienyl compounds to the lithiated ligand precursor. These procedures are not cost effective due to a requirement for excess $\text{Cl}_2\text{Si}(\text{CH}_3)_2$, the production of undesirable by-products, and a consequent need for expensive purification procedures.

DEFINITIONS

In this specification, the following expressions have the meanings set forth:

20

1. MsO means $\text{CH}_3\text{O}_3\text{S}$ or $\text{CH}_3-\overset{\text{O}}{\underset{\text{O}}{\text{S}}}-\text{O}-$

2. MsOH means $\text{CH}_3\text{O}_3\text{S}$ or $\text{CH}_3-\text{S}-\text{OH}$

5

3. TfO means $\text{CF}_3\text{O}_3\text{S}$ or $\text{CF}_3-\text{S}-\text{O}$

10

4. TfOH means $\text{CHF}_3\text{O}_3\text{S}$ or $\text{CF}_3-\text{S}-\text{OH}$

15

5. Monocyclopentadienyl ligand means any ligand having the formulae $\text{C}_5\text{H}_x\text{R}_y$, wherein:

$x = 0-5$

$y = 0-5$

20 $R =$ any alkyl or aromatic group or combination thereof, and H or R can occupy any one or more of the positions 1 to 5 of the formula

For example, R may be an alkyl group having one to eight carbon atoms including but not limited to methyl, ethyl, propyl, isopropyl, butyl, tertbutyl, hexyl or octyl. Methyl is the preferred alkyl group. R, when an aromatic group, may be phenyl, xylyl, mesityl, naphthyl or fluorenyl.

6. Silylated monocyclopentadienyl ligand means any ligand having the formula $(R_3Si)_Z C_5H_X R_Y$, wherein $C_5H_X R_Y$ is as defined in definition 5, $Z=1-5$ and R and R_Y are identical or different alkyl or aromatic groups.

7. N-silylated monocyclopentadienyl ligand means any ligand having the formula $RNH(SiR_2)C_5H_X R_Y$, wherein $C_5H_X R_Y$ is as defined in definition 5, and R and R_Y are identical or different alkyl or aromatic groups.

8. Silylated biscyclopentadienyl ligand means any ligand having the formula $(C_5H_X R_Y)_2 SiR_2$, wherein $C_5H_X R_Y$ and R_Y are as defined by definitions 6 and 7.

9. Silylated monoindenyl ligand means any ligand having the formula $(R_3Si)(C_6H_X R_Y)$ wherein

$X = 0-7$

$Y = 0-7$

H or R can occupy any positions 1 to 7 and R_3Si can occupy only position 3 of the formula

wherein R and R_y are as defined by definitions 6 and 7.

10. N-silylated monoindenyl ligand means any ligand
 5 having the formula $RNH(SiR_2)C_9H_xR_y$, wherein R and R_y are as defined by definitions 6 and 7. ($C_9H_xR_y$) is as defined in definition 9 and wherein $x = 0-7$ and $y = 0-7$.

11. Silylated bisindenyl ligand means any ligand
 having the formula $(R_2Si)C_9H_xR_y$ wherein R and R_y are as
 10 defined in definitions 6 and 7; $x = 0-7$ and $y = 0-7$.

SUMMARY OF THE INVENTION

One aspect of the invention includes novel silanes
 having the Formula (I):

15 or the Formula (II):

in which X is H or F, each R in formula (I) may be the same
 5 or a different alkyl or aromatic group as defined by
 definition 5 with the proviso that when X is F in formula
 (I), R is not methyl, and R¹ is an alkyl or aromatic group
 which may be the same or different from R.

Another aspect of the invention is a method for the
 10 synthesis of silylated and N-silylated compounds having the
 Formula (III)

or the Formula (IV)

15 in which Y is any organic group and in which R and R¹ are
 the same or different organic groups, preferably substituted
 or unsubstituted aliphatic or aryl groups as defined by
 20 definition 5.

The invention includes methods for reacting organic
 alkali metalides having the formula YM, in which Y is any
 organic group and M is any alkali metal with a silane having

the Formula (I) or Formula (II) wherein the product is a compound having the Formula (III) or Formula (IV).

A first step of such methods includes preparation of an organic alkali metalide. Methods for the preparation of such compounds are known. For example, any compound having a -CH group, preferably acidic, is reacted with an alkali metal alkyl having the formula R^3M , in which R^3 may be any hydrocarbyl group and M may be lithium, potassium or sodium. M may also be a magnesium halide. N-butyl lithium or tert-butyl lithium are preferred RM compounds. The reaction is conducted in a non-interfering solvent, preferably diethyl ether or tetrahydrofuran, which may also include or be combined or mixed with a hydrocarbon such as toluene. The reaction mixture contains a desired alkali metalide.

In a second step, the alkali metalide product of the first step is optionally but not necessarily isolated from the first step reaction mixture and reacted with a silane having the Formula (I) or the Formula (II). Methods for such isolating such compounds are known.

In one aspect of the invention, the compound having -CH group is a C_3 -ring containing compound useful as an olefin

polymerization catalyst ligand or as a precursor of such a ligand. Such ligands include but are not limited to substituted, unsubstituted, mono-, or bis- cyclopentadienyl, indenyl, naphthenyl and anthracenyl ligands. These ligands
 5 may be hydrogenated. For example, such ligands include cyclopentadienes, bis-cyclopentadienes, indenenes, bis-indenenes, mono- and poly- alkyl, preferably methyl, substituted cyclopentadienes and indenenes, such as tetraethyl cyclopentadiene and 2-methyl indene, 2-methyl-benzo(indene),
 10 bis-2-methyl-benzo(indene), dimethyl silane, substituted, unsubstituted and bis-phenanthrene, and cyclopentaphenanthrene which may be but need not be hydrogenated.

Another aspect of the invention may include a method
 15 which comprises combining a compound having the formula $Q^1-(Z)-Q^2Li_2$ and a compound having the formula $R^1_3SiO_3R^2$ in a non-interfering solvent wherein said compound having the formula $Q^1-(Z)-Q^2Li$ reacts with the compound having the formula $R^1_3SiO_3R^2$ to produce a compound having the formula

or

$R^1_3SiQ^1$ where Q^1 =indene

or

$R^1_3SiQ^2$ where Q^2 =cyclopentadiene

wherein R^1 and Q^1 and Q^2 each have 1 to 10 carbon atoms are
5 the same or different aryl, preferably phenyl, and R^2 are
identical or different alkyl groups.

Specifically, Q^1 and Q^2

(i) may be the same or different;

(ii) are preferably unsubstituted;

10 (iii) may be substituted at any position not
occupied by linkage to $(Z)_x$ or to lithium and

(iv) Z is a linking group, preferably $(CH_2)_y$ in
which y is 1 to 6 or $Si(R^2)$ wherein R^2 is a 1 to 6
carbon atom alkyl group.

15 Useful Q^1 and Q^2 substituents include one to six carbon
atom alkyl, preferably methyl, groups; halogens, preferably
chlorine, fluorine or bromine, and substituents which form
rings with two Q^1 or Q^2 carbon atoms.

Compounds having the formula $Q^1(Z)Q^2Li$ are prepared in
20 known manner by reacting a compound of formula $Q^1(Z)_xQ^2$ with
an alkyl lithium compound, preferably n-butyl or t-butyl

lithium in a non-interfering solvent, preferably ether or tetrahydrofuran. The lithiation reaction is appropriately conducted at a temperature of from about -80°C to about 40°C.

5 The reaction mixture which contains lithiated $Q^1-(X)_x Q^2$ may be combined directly with $R^1_3SiO_3SR^2$ to yield $R^1_3SiQ^1(X)_x Q^2SiR_3$. The reaction proceeds to substantial completion in about thirty minutes at room temperature. See Example 8. Alternatively, the lithium salt may be isolated prior to
10 reaction with $R^1_3SiO_3SR^2$.

DETAILED DESCRIPTION OF THE INVENTION

The Formula (I) silanes may be prepared by reacting a compound of the formula R^1SO_3H , in which R^1 is any straight or branched chain alkyl group preferably having one to eight
15 carbon atoms, with a compound of the formula X_2SiQ_2 , in which X and Q are as defined.

The synthesis of one Formula (I) silane is illustrated by Equation 1:

RT = Room Temperature.

The novel Formula (II) silanes are synthesized by reacting RSO_3H with a compound having the formula $(\text{YNH})_2\text{SiQ}_2$, in which R and Q are as defined, and Y is an alkyl group which may be the same as or different from Q. See

Equation 2:

EXAMPLE 1

Preparation of Formula I Silane - $(\text{MSO})_2\text{SiMe}_2 \cdot 0.5 \text{HCl}$
 $[(\text{CH}_3\text{O}_3\text{S})_2\text{Si}(\text{CH}_3)_2 \cdot 0.5\text{HCl}]$. To a 500 mL flask containing neat Cl_2SiMe_2 (64 g., 0.50 mol) was added MsOH (97 g., 1.01 mol); the immiscible solution rapidly evolved HCl that was scrubbed with NaOH (250 g., 50 wt% solution) or with iced water. After the solution was stirred overnight, the homogeneous oil was sparged with N_2 gas an additional day. This synthesis is illustrated by Equation 3:

^1H NMR analysis of the product showed that one equivalent of HCl was present with two equivalents $(\text{MSO})_2\text{SiMe}_2$; yield is quantitative.

EXAMPLE 2

Preparation of a Formula (II) Silane - MsOSiMe_2

5 (a) Preparation of $(t\text{-BuNH})_2\text{SiMe}_2$ (equation 4).

A 12 L flask equipped with an additional funnel and reflux condenser was charged with $t\text{-BuNH}_2$ (11 mol, 805 g) and THF (7 L). The solution was slowly treated with Cl_2SiMe_2 (5 mol, 645 g) that resulted in an endothermic reaction.

10 After the temperature had dropped to 40°C , the white slurry was filtered, the $t\text{-BuNH}_2\text{Cl}$ was washed with THF (1 L), and the filtrate was reduced to an oil that contained 97% pure $(t\text{-BuNH})_2\text{SiMe}_2$ (^1H NMR). Yield was quantitative (1 Kg).

See equation 4.

(b) Preparation of $\text{MsOSi}(\text{CH}_3)_2$

The $(t\text{-BuNH})_2\text{SiMe}_2$ prepared as described in Example 2(a) was added to one equivalent of neat $(\text{MsO})_2\text{SiMe}_2 \cdot 0.5\text{HCl}$ at room temperature, resulting in a 50-60°C exotherm. The resulting oil which contained insoluble solids was filtered through a glass frit to give >98% pure $(t\text{-BuNH})(\text{MsO})\text{SiMe}_2$ (^1NMR). See equation 5.

EXAMPLE 3

Formula (II) Silane - $\text{CF}_3\text{O}_2\text{S-Si}(\text{Me}_2)_2$

$\begin{array}{c} | \\ \text{NH}(t\text{-butyl}) \end{array}$ was prepared as

described in Example 2 (Equation 5) except that

$(\text{TfO})_2\text{Si}(\text{Me})_2$ replaces $(\text{MsO})_2\text{SiMe}_2 \cdot 0.5 \text{HCl}$.

EXAMPLE 4

Preparation of 2-Methylcyclopentadienyl(*t*-Butylamido) Dimethylsilane (Equation 6). A 1 L flask was charged with 2-methylcyclopentadiene (16 g, 200 mmol) and THF (160 g). The solution was cooled (-10°C) and treated with *n*-BuLi (1.6 M,

125 mL, 200 mmol). After the resulting white heterogeneous solution was stirred at room temperature for thirty minutes, the solution was treated with (t-BuNH)(MsO)SiMe₂ (47 g, 190 mmol) and the solution was stirred overnight. The solution
 5 was filtered through Celite, the residual LiOMs was washed with ether (500 mL), and the filtrate was reduced to a light-green oil. No further purification was necessary. Yield was quantitative.

(6)

In this example, 2-methylcyclopentadiene may be
 10 replaced by cyclopentadiene to provide a quantitative yield of cyclopentadienyl (t-butyl amido) dimehtylsilane.

Also in this example, 2-methylcyclopentadiene may be replaced by 3-methyl-2-ethyl-cyclopentadiene to provide a

quantitative yield of 3-methyl-2-ethyl-cyclopentadienyl
(*t*-butyl amido) dimethylsilane.

Also in this example, $t\text{-BuNHTfOSi}(\text{Me})_2$ may be used with
similar results.

5 This example illustrates a method in which a type II
silane is added directly to the reaction mixture in which an
alkali metalide is formed. Alternatively, the alkali
metalide, here lithium-2-methylcyclopentadiene, may be
isolated from the reaction mixture in known manner and
10 thereafter reacted with either a type I or type II silane.

EXAMPLE 5

Preparation of 2-Methylindenyl(*t*-Butylamido)

Dimethylsilane (Equation 7). A 5 L flask was charged with
2-methylindene (1.67 mol, 217 g) and ether (1.5 L). The
15 solution was cooled (-10°C) and treated with BuLi (1.67 mol,
1.04L). After the solution was stirred for one hour at room
temperature, the solution was cooled (-10°C) and
 $\text{Me}_2\text{Si}(\text{MsO})\text{NH}(t\text{-Bu})$ (a type II silane) was added in one
portion, resulting in a 20°C exotherm. After one hour at
20 room temperature, the solution was filtered through Celite,
the residual solid LiOMs was washed with ether (1.5 L), and

the filtrate was reduced to a yellow oil that contained >98% pure 2-methylindenyl(*t*-butylamido) dimethylsilane (¹H NMR) in quantitative yield.

In this example, (*t*-BuNH)TfOSiMe₂ may be used instead
 5 of *t*-BuNH(MsO)SiMe₂.

Also, in this example, 2-methylindene may be replaced with fluorene to provide a quantitative yield of 9-fluorenyl-*t*-butyl amido dimethyl silane.

Also, in this example, 2-methylindene may be replaced
 10 with bromobenzene to obtain a quantitative yield of the expected phenyl-*t*-butylamido dimethyl silane.

EXAMPLE 6

Preparation of bis(2-methyl-benzoindenyl)
dimethylsilane (equation 8). A 2L flask charged with 2-
 15 methyl-benzo(indene) (73 g, 405 mmol) and ether (500 mL) was

cooled to -10°C and treated with n-BuLi (1.6 M, 255 mL, 405 mmol). The solution was allowed to warm to room temperature for 30 minutes, cooled to about -10°C , and then treated with a neat Formula I silane $(\text{MsO})_2\text{SiMe}_2 \cdot 0.5 \text{ HCl}$ (54g, 203 mmol) resulting in a $10\text{-}15^{\circ}\text{C}$ exotherm. After one hour at room temperature, the white slurry was treated with CH_2Cl_2 (500 mL), and the solution was filtered through Celite into a 5L flask. The solids were washed with CH_2Cl_2 (500 mL), and the filtrate was evacuated to dryness. The white solid residue was treated with ether (200 mL), and the solvent was evacuated so that most of the residual CH_2Cl_2 was removed. The solid was then treated with ether (1 L) and trituated for thirty minutes before filtering and washing the white solid with ether (200 mL). Yields vary from 20-50%. The 2-methyl-benzo(indene) was recovered by treatment of the filtrate with NaOH (20 wt%) in THF.

The above procedure was repeated, except that $(\text{MSO})_2\text{SiMe}_2 \cdot 0.5\text{HCl}$ was replaced with $\text{TfO}_2\text{Si}(\text{Me})_2$. The yield of bis(2-methyl-benzoindenyl) dimethylsilane was 60-65% of the bis(2-methylbenzoindenyl) dimethylsilane.

5

EXAMPLE 7

Preparation of Metallocene Catalyst from the Example 5 Product (Equation 9). A 1 L flask was charged with bis(2-methyl-benzoindenyl) dimethylsilane (48 g, 115 mmol), toluene (480 mL), and ether (20 g, 270 mmol). The solution was cooled (-10°C) and then treated with BuLi (1.6 M, 145 mL, 230 mmol). After the tanned-colored heterogeneous solution was stirred at room temperature for two hours, the solution was cooled (-20°C) and treated with ZrCl_4 (27 g, 115 mmol). By the time the solution had warmed to

-10°C, a bright yellow solution had resulted. After the yellow solution was stirred at room temperature for 2 hours, the solution was filtered, and the yellow solid was washed with toluene until the filtrate was pale yellow. The yellow
5 filter cake was treated with an equal mass of Celite, the solids were slurried in dry CH_2Cl_2 , and the product was extracted with CH_2Cl_2 through a layer of Celite into a 12 L flask that contained toluene (1 L); the extraction was stopped when the yellow color of the filtrate had turned
10 translucent. The CH_2Cl_2 solvent was evaporated to give a toluene-slurry of yellow crystals. The solution was filtered, the yellow crystals were washed with toluene (1 L), and the yellow solid was slurried in toluene (5 L) for four hours. The solution was filtered to give 28 grams
15 of diastereomerically pure metallocene (^1H NMR; yield - 38%).

EXAMPLE 8

Preparation of Bis(3-Trimethylsilyl (TMS) indenyl)

ethane (Equation 10). A 1L flask was charged with ethylene
bis-indene (EBI) (0.100 mol, 26g) and THF (260g). The
5 solution was cooled (-10°C) and treated with BuLi (0.200
mol. 125 mL). After one hour at RT, the solution was cooled
(-10°C) and treated with Me₃Si(OMS) (0.200 mol., 34 g) in
one portion. After thirty minutes at RT, the solution was
filtered through Celite, the solids containing rac/meso
10 bis(TMS) EBI were washed with THF (130 g), and the filtrate
was reduced giving a solid that contained 98% rac-meso

product in >98% yield. The product was extracted with heptane to separate the rac and meso isomers.

This procedure is illustrated by the following equation 10:

The above procedure was repeated with several analogs of EBI with similar results. Specific analogs of EBI were bis(2-methylindenyl) ethane, bis(4,7-dimethylindenyl) ethane, cyclopentadiene and methylcyclopentadiene. In this example, $\text{Me}_3\text{Si(OTf)}$ may be used instead of $\text{Me}_3\text{Si(OMS)}$.

EXAMPLE 9

Preparation of N-Silylated Cyclopentadiene. This procedure is illustrated by equation 11:

Cyclopentaphenanthrene is mostly dissolved in diethyl ether (800 mL), n-BuLi is added, and the reaction mixture was stirred overnight.

was added neat, followed by stirring for one-half hour. The reaction mixture was filtered. Ether was removed. Yield - quantitative. In this reaction, any compound of Formula (II), page 5, may be used instead of t-butyl NHMSOSiMe₂. Compounds obtaining the corresponding R groups instead of t-butyl are produced.

15 In this example, CF₃SO₂Si(CH₃)₂NH t-butyl may be used instead of CH₃SO₂Si(CH₃)₂NH t-butyl.
